

In the Abstract:

Please delete the paragraph at page 37, lines 2 to 18.

Please add a new paragraph at page 37, line 19 as follows:

An electric contact of a plug connector is formed by folding a blank, and is inserted into a receiving cell of a housing and fitted to the housing. The electric contact includes a tab formed of a base plate and a contact plate folded so as to overlap one another in the thickness direction. The rear end of the base plate includes a protruding part that protrudes beyond the rear end of the contact plate in the depth direction. When the contact body is set in the receiving cell of the housing, the base plate of the tab protruding out of the receiving cell is supported by the housing, and the protruding part of the base plate is fitted in and held by the housing to prevent the tab from lifting from the housing in the thickness direction.
